

# SIL765 - Assignment 1

Name : *Jitesh Shamdasani*

Entry Number : *2024/CS2043*

Date of Submission : *12/01/2025*

## Overview

The DecipherText class implements a hill-climbing algorithm to decrypt ciphertext based on trigram frequencies. This algorithm aims to maximize the similarity of decrypted text to English text by optimizing a key through iterations. The fitness of the deciphered text is determined using trigram statistics derived from English text.

The algorithm intelligently swaps characters in the decryption key to improve the fitness score iteratively. If the fitness score reaches a local maximum without finding the true solution, the process restarts multiple times to find better keys and plaintext.

## Procedure

### Input

- Ciphertext: The encoded text that needs to be deciphered.
- TRIGRAMS Dictionary: A dictionary containing trigram frequencies used to evaluate the fitness of deciphered text.

### Steps

- Initialization:
  - Trigram probabilities are converted to logarithmic values for efficiency.
  - A random key (current\_key) and the initial fitness score are generated.
- Hill-Climbing Algorithm:
  - Randomly swap two characters in the key (randomize function).
  - Calculate the fitness score of the text deciphered with the new key.
  - If the fitness score improves, the new key is retained; otherwise, it might be retained with a probability influenced by a random\_factor (to escape local maxima).
  - Repeat this process until 10,000 iterations without improvement occur.
- Decipher Final Text:
  - Decrypt the ciphertext with the best key found.
  - Maintain special characters and spaces from the original ciphertext.
  - Map the deciphered characters to the original ciphertext to create the final key.
- Output:
  - The deciphered plaintext.
  - The deciphered key.

### Scoring

- Fitness is computed using trigram probabilities (compute\_scores).
- Higher scores indicate text closer to standard English.

### Randomization and Decay

- A random\_factor is used to occasionally accept worse keys to escape local maxima.
- This factor decays over time to prioritize better keys as the iterations progress.

## Function Explanations

score\_sequence(seq, score\_dict, block\_size, default\_value)

Purpose:

Calculates the fitness score of a sequence (text) based on trigram probabilities.

Explanation:

- Input:
  - seq: The text sequence to evaluate.
  - score\_dict: The dictionary containing trigram probabilities.
  - block\_size: The size of the trigrams (fixed at 3 for trigrams).
  - default\_value: The score to assign for unknown trigrams.
- Process:
  - Splits the sequence into overlapping blocks of block\_size (trigrams).
  - For each block, fetches its score from score\_dict. If the trigram is not found, uses default\_value.
  - Accumulates the scores of all blocks to produce the total score for the sequence.
- Output:
  - The total fitness score of the sequence.

compute\_scores(new\_key, letter\_set, word\_list, scores, size, def\_val)

Purpose:

Computes the fitness score of the text produced by applying a candidate decryption key to the ciphertext.

Explanation:

- Input:
  - new\_key: A trial decryption key.
  - letter\_set: Unique characters from the ciphertext.
  - word\_list: List of words in the ciphertext (without anchors).
  - scores: The trigram score dictionary.
  - size: Size of trigrams.
  - def\_val: Default score for unknown trigrams.
- Process:
  - Maps characters in the ciphertext to their decrypted equivalents using new\_key.
  - Transforms each word in word\_list using the mapping.
  - Calculates the fitness score of the transformed words using score\_sequence.
  - Returns the cumulative score for the entire text.
- Output:
  - The total fitness score for the text using the new\_key.

decryptt(char\_list, key\_try, word\_list)

Purpose:

Generates decrypted text by applying a candidate decryption key to the ciphertext.

Explanation:

- Input:
  - char\_list: Unique characters from the ciphertext.
  - key\_try: A trial decryption key.
  - word\_list: List of words from the ciphertext (without anchors).
- Process:
  - Maps characters in the ciphertext to their decrypted equivalents using key\_try.
  - Iterates over word\_list and replaces each character based on the mapping.
  - Combines the transformed words into a single decrypted string.
- Output:
  - The decrypted text.

randomize(key\_str)

Purpose:

Randomly swaps two characters in a key string to create a new candidate key.

Explanation:

- Input:
  - key\_str: The current decryption key.
- Process:
  - Converts the key into a list of characters.
  - Selects two random indices in the key.
  - Swaps the characters at the selected indices.
  - Converts the modified list back into a string.
- Output:
  - A new randomized key.

## Outputs

- Deciphered Plaintext: The human-readable text derived from the ciphertext.
- Deciphered Key: The key mapping used to decrypt the ciphertext.

Example:

Plain Text-4

Deciphered Plaintext: before sunrise is a romantic drama film directed by richard linklater and written by linklater and kim krizan. the first installment in the before trilogy, it follows jesse, ethan hawke and celine, julie delpy as they meet on a eurail train and disembark in vienna to spend the night together. inspired by personal experiences, linklater collaborated with kim krizan to develop the screenplay, who previously appeared in his films slacker and dazed and confused. casting was extensive, it took nine months for hawke and delpy to be cast, with the pair also contributing uncredited rewrites. principal photography took place entirely in vienna. good film to watch

Plain Text-5

Deciphered Plaintext: titanic is an american epic romance and disaster film directed, written, produced, and co edited by xames cameron. incorporating both historical and fictionalized aspects, it is based on accounts of the sinking of the rms titanic, and stars leonardo dicaprio and kate winslet as members of different social classes who fall in love aboard the ship during its ill fated maiden voyage. cameron inspiration for the film came from his fascination with shipwrecks, he felt a love story interspersed with the human loss would be essential to convey the emotional impact of the disaster. production began when cameron shot footage of the actual titanic wreck. another good film
